This explication seems to me to have no advantage, to mean no more than the relation of the simple fact itself, besides being much more difficult to remember. Furthermore, it seems more simple to suppose that the reacting substance exerts two different actions on the cells, of which the one, appearing at higher concentrations, hinders the other, prevailing at lower concentrations. Such a behaviour is not rare in common chemistry. Thus, for instance, the addition of alkali to a solution of aluminium chloride gives a precipitate of aluminium hydrate, which is dissolved on further addition of alkali. In a brochure dealing with the properties of colloids Biltz<sup>1</sup> Biltz: Gottinger Nachrichten, math.-phys. Klasse 1904, I, Zeitschr. f. ph. Ch. 48. 615 (1904). recalls attention to the oft-observed fact that in general positive colloids (which wander in the electric field in the same manner as cations) precipitate negative colloids (which wander in the same direction as anions under the influence of the electric current). This reminds one somewhat of the specificity of agglutinins. As we shall see later on, Henri accepted this idea, but later he found it disproved by experiments on agglutinins. Biltz found, further, that in the precipitation of colloids optima are found. Thus, for instance, the addition of 1.62 mg. oxid of zircon gave a more abundant precipitate with 1.4 mg. gold in colloidal solution than greater or less quantities; 3.25 mg. ZrO<sub>2</sub> gave no precipitate at all. In the same manner behaved 4 mg. thorium oxid (as colloidal hydrate) with a colloidal solution containing 5.5 mg. SO<sub>2</sub>S<sub>3</sub>. In this point also the colloids present analogies with common dissolved inorganic substances....

Immunochemistry is the demonstration of a particular antigen (typically a protein) in a histological tissue section (immunohistochemistry (IHC)) or cytological preparation (immunocytochemistry (ICC)), using an antibody that specifically binds to that antigen. Immunochemistry is the study of the identities and functions of the components of the immune system. Immunochemistry is also used to describe the application of immune system components, in particular antibodies, to chemically labelled antigen molecules for visualization. Immunochemistry is the study of immunological proteins within different biological fluids including serum, urine and CSF. The detection of these proteins .
