

Wastewater treatment is usually characterized as consisting of four sequential processes: preliminary, primary, secondary and tertiary (sometimes called "advanced" treatment). This course is a discussion of preliminary treatment. Preliminary treatment of wastewater includes screening, grinding, grit removal, flotation, equalization, and flocculation. Screens, grinders and grit removal are provided for the protection of other equipment in the treatment plant. Air flotation and flocculation aid in the removal of suspended solids and oil in the primary clarifier and reduce the biological loading on secondary treatment processes. Prechlorination or pre-aeration may be required to prevent odor problems and to eliminate septic conditions where wastewater has abnormally long runs to the plant. Equalization structures are used to dampen diurnal flow variations and to equalize flows to treatment facilities.

Silent Samurai and the Magnificent Rescue (Fujimini Adventure Series Book 3), Wild Flowers of North Carolina, Green Light: and other motivating messages, An act to authorize appropriations for the National Aeronautics and Space Administration for fiscal years 2000, 2001, and 2002, and for other purposes., Afraid (Feelings),

preliminary wastewater treatment engineering pdf general heading: 'Wastewater Treatment Manuals'. Where criteria and procedures are published by the.
